Dear Chairman Hoeven, Chairman Bishop, Ranking Member Merkley, and Ranking Member Fortenberry:

We, the undersigned organizations, are writing to request your support for $40 million in appropriations for the Agricultural Genome to Phenome Initiative. This initiative was established in the 2018 Farm Bill and recognizes the critical need for increased federal investment to advance genomics in agriculturally important plant and animal species. The FY 2020 Consolidated Appropriations’ bill included funding to execute the planning process for the project, and we urge the committee to follow up those planning funds with full funding to execute the multi-state research and development project.

It is widely acknowledged that obtaining phenotype information is a major limiting step in converting genomic information into useful improvements in agriculturally important species. Significant research is needed to fully characterize the phenotypes, which are collectively known as the “phenome” of our major crop and livestock species. Understanding the relationships between genes and trait phenotypes will eventually allow farmers and ranchers to enhance production by identifying optimal combinations of genetics and management practices. The Agricultural Genomes to Phenomes Initiative will develop tools and knowledge to allow for the analysis of phenotypes across a diverse array of agriculturally important species, and help individual farmers make better management decisions and achieve higher stable productivity.

Investments in the Agricultural Genome to Phenome Initiative will support:

- Studying agriculturally significant crops and animals in production environments to achieve sustainable and secure agricultural production.
• Ensuring that current gaps in existing knowledge of agricultural crop and animal genetics and phenomics are filled.
• Identifying and developing a functional understanding of relevant genes from agriculturally important animals and crops.
• Ensuring future genetic improvement of crops and animals of importance to the agriculture sector of the United States.
• Studying the relevance of diverse germplasm as a source of unique genes that may be of importance in the future.
• Enhancing genetics to reduce the economic impact of pathogens on crops and animals of importance to the agriculture sector of the United States;

We respectfully request that **$40 million** be appropriated for the Agricultural Genome to Phenome program in fiscal year 2021 to support this important work. Please let us know if you have any questions or if we can be of any assistance as the FY 2021 appropriations process moves forward.

Sincerely,
